

Minutes of Meeting

Date: 12 March 2026

Time: 3:00pm – 5:00pm

Location: Zoom meeting

Attendees:

Hao Zhiyi

Wu Yanjie

Fang Yu

Agenda Items

Determine data source

Discuss analytical approaches

Assign analysis tasks

Key Discussion Points

Data Source Selection:

- Hao Zhiyi initially suggested focusing on trade data between Singapore and developed countries, as these countries are often major economic partners.
- Wu Yanjie pointed out that limiting the analysis to developed countries may not provide a comprehensive view of Singapore's trade patterns.
- Fang Yu agreed and added that using the full dataset would allow the team to identify the most significant trading partners, which may not necessarily be developed countries.
- The team discussed the importance of maintaining a broad analytical scope before narrowing down.

Conclusion: All members agreed to use Singapore's complete import and export dataset for a more comprehensive and unbiased analysis.

Analytical Approaches:

- The team initially agreed to apply three analytical methods: Geospatial Analysis, Cluster Analysis, and EDA & CDA on the full dataset.
- Wu Yanjie raised a concern that performing EDA on the entire dataset might lack focus and make it difficult to derive meaningful insights.
- Fang Yu suggested narrowing the scope by first identifying the top 10 import and export partner countries.

- Hao Zhiyi agreed that focusing on key countries would allow for more targeted and insightful analysis.
- The team discussed combining both approaches: broad analysis for pattern discovery and focused analysis for deeper insights.

Conclusion:

- Use cluster analysis on the full dataset to identify overall trade patterns.
- Use EDA & CDA on the top 10 common trading partner countries for in-depth analysis.
- Use geospatial analysis to visualise global trade distribution.

Analytical Focus Strategy:

- Cluster analysis will be applied to the entire dataset for overall pattern discovery.
- EDA & CDA will focus on the top 10 common trading countries to examine detailed trade behaviour and statistical relationships.
- Geospatial analysis will complement findings by providing spatial insights into trade distribution.

Decisions

- Use Singapore's full import-export trade dataset as the primary data source.
- Apply three main analytical methods:
 - Geospatial Analysis
 - Cluster Analysis
 - EDA & CDA
- Focus detailed analysis (EDA & CDA) on the top 10 common trading partner countries.

Action Items

Task	Description	Assigned Member	Deadline
Cluster Analysis	Perform clustering on full dataset to identify trade pattern groups	Hao Zhiyi	16 March 2026
EDA & CDA	Conduct exploratory and confirmatory	Wu Yanjie	16 March

	analysis on top 10 countries		2026
Geospatial Analysis	Create global trade maps to visualise trade distribution	Fang Yu	16 March 2026

Next Meeting

- **Objective:** Review preliminary analysis results and refine methodology
- **Date & Time:** To be confirmed
